## ANNOUNCEMENT

### Munni Munni Joint Venture

During May-June 2002 several new structural/alteration targets were identified along the Munni Munni Fault and related fault zones. Twenty two altered rock samples were collected during the mapping and analysed for silver. A sample of the original "discovery gossan" from the Elizabeth Hill mine recorded 24.0g/t Ag. Best results from the new targets included 22.1g/t and 0.8g/t Ag from gossanous material in the West Hill area approximately 600 metres from the mine. Mapping and sampling is continuing.

The current Reverse Circulation drilling programme has been completed for a total of 39 holes mainly targeting the Munni Munni Fault and related structures, up to 3 kilometres south and one kilometre north of the mine. Many of the holes intersected good carbonate veining and alteration associated with the Munni Munni fault zone. Geological interpretation of this data has commenced.

Eleven of these holes were drilled within the mine area to further define and extend the known shallow silver resource, and to assess the open pit potential.

Three metre composite samples were routinely collected from all holes. Intervals with good alteration were more closely sampled over one metre intervals. Samples will be dispatched to the laboratory during the next few days and results should be available in 3 to 4 weeks. Based on these results, a further drilling programme is planned.

Information on exploration results contained in this release is based on reports compiled by consulting geologist Mr Finn Barrett MSc, MBSA, MAIG, MSEG of Barrett Exploration Pty Ltd. Mr Barrett consents to the inclusion of this release of the matters based on his reports in the form and context in which it appears
